WINSTONE CRM

Production Readiness / Audit Report

Document 1.1.0 · Audit 2026-09-30 13:40 UTC (19:40 Asia/Dhaka) · Version c9a5020 + final audit changes

Implementation audit: PASS (code, database and automated tests)

This covers code, database and automated-test verification only. External operational checks are listed separately below and are not certified here. No legal or security guarantee is made.

Item	Result	Evidence
1. Call readiness	PASS (code/test)	Web startMyCall and Android /api/public/agent/call-start derive the agent from the signed-in session or device token only. Order: 9:05 briefing → staff photo → one-pending-report lock (unique DB index) → lead must be assigned to this agent. Fixed during the audit: unassigned pool leads could be dialled; now refused.
2. Agent scope	PASS (code/test)	Agent snapshot queries filter by the caller's profile id on the server; HQ/IT PIN scope reads the whole floor; RLS on every public table (0 tables without RLS).
3. Data integrity	PASS (code/test)	Dashboard snapshot pages through all rows (no latest-500 cap). 3,980 leads, 2,935 reports read from real records. One staff-created row named "IT Test" (source agent_app) exists and is kept — leads are never deleted.
4. Contact-close reason	PASS (code/test)	DB trigger enforce_contact_close_reason rejects a closed report without a canonical reason; "other" requires a note (no_follow_up_note). log_contact_close writes an immutable contact_closed lead event. Shared list in contact-close-reasons.ts (web) and ContactCloseReasons.kt (Android).
5. Permanent history	PASS (code/test)	Append-only: lead_events, lead_state_changes, follow_up_changes block UPDATE/DELETE by trigger; no UPDATE/DELETE policies. Triggers log assignment/status/work state/temperature, report status + corrections, new calls, follow-up create/reschedule/complete/cancel. Each history row carries a unique correlation_id.
6. Lead 360	PASS (code/test)	Full timeline read in 1000-row pages from all event sources, de-duplicated by id; filters phone/ID/name/agent/source/requirement/reason/event/status/date; cursor pages of 40 with total count.
7. Reports / export	PASS (code/test)	Server-built CSV and print-ready HTML for filtered Lead 360 results (filters + generated-at stamp, formula-neutralised cells); per-lead full-history CSV/print; follow-up history Excel/PDF scoped HQ=all, agent=own.

Item	Result	Evidence
8. Canonical manual	PASS	system-manual.ts v1.1.0 → /manual page and /winstone-system-manual.pdf, card in Executive HQ and IT Console.
9. Home daily performance	PASS (code/test)	Top 3 computed from that day's real reports/follow-ups; score breakdown shown; ties broken by calls → reports → talk minutes → id.
10. Responsive QA	PASS (public pages)	/, /manual, /desk, /audit-report, /handover at 390/768/1280/1920 px: no horizontal overflow, no page errors. PIN/sign-in-only screens were not rendered in the automated check.
11. Tests	PASS	tsgo --noEmit: 0 errors. bunx vitest run: 38 files, 269 tests passed (2026-09-30, incl. 26 Sales Intelligence tests).
12. Sales Intelligence	PASS (code/test)	Migration 0066: market_facts, pitch_templates, knowledge_versions, pitch_events (FK to canonical leads/profiles, unique correlation_key, UPDATE/DELETE blocked by trigger, server-only RLS). Actor from session; agent limited to own assigned lead; 9:05 gate on pitch writes; AI grounding validator rejects uncited facts/invented numbers; wa.me recorded as opened only; deterministic attribution; keyset pagination; full-page export. tests/sales-intel.test.ts: 26 tests. Not verified: signed-in screens end-to-end, live AI replies with real published facts (no facts entered yet).

Scope audited

Source code (web + server + Android sources), database schema, triggers, indexes and RLS, call initiation and reporting paths, history model, 09:05 briefing gate, Lead 360, exports, manual and public-page responsive layout.

Architecture summary

Web app and server functions run on one TanStack Start deployment; Lovable Cloud database with row-level security; Android app (Kotlin) calls from the agent's own SIM and syncs through device-token APIs under /api/public/agent.

Lead sources → LeadHub Nexus (normalise, dedupe) → canonical lead database (unassigned) → LeadHub quantity assignment → agent → call → report → CRM derives score/priority → follow-up or contact close.

Role / permission matrix

Role	Leads	Assign	Approve accountability	System settings
Agent (all peers)	Own assigned only	No	No	No
Executive HQ (PIN)	All (read)	No	Yes	No
IT Console (PIN)	All (read)	No	No (monitor only)	Yes
LeadHub Nexus (own PIN)	Pool	Yes — only path	No	No

Call lifecycle

Agent taps call → server checks briefing, photo, pending report and lead ownership → call_started event → call from own SIM → recording/call row synced (duplicate-safe by client_upload_id / external_call_id) → mandatory post-call report (one pending per agent) → submit validated by DB triggers.

Lead lifecycle

Imported → unassigned → assigned by LeadHub → called → reported → follow-up or contact closed with reason → completed/converted. Never hard-deleted; duplicates parked as duplicate_skipped. Phone numbers normalised to Bangladesh format with a unique phone key.

Follow-up lifecycle

Created from a report with a structured reason → reminders 30 min before and every 3 h while overdue → rescheduled / completed / cancelled. Delete is blocked; every change writes old/new time, status, reason, note and actor.

Permanent history / audit model

lead_events (facts), lead_state_changes (field old/new), follow_up_changes (follow-up old/new), audit_logs (privileged actions). History tables reject update/delete; timestamps stored in UTC and shown in Asia/Dhaka.

09:05 briefing gate

After 09:05 Asia/Dhaka each agent must acknowledge the current policy version (2026-09-30-v1) for the current business date. Enforced server-side on call start (web + Android), report submit, follow-up complete/reschedule, WhatsApp logging, lead sorting and new-number calls. Acknowledgements are unique per agent/date/version and immutable.

Lead 360 and filtering

HQ search by phone, lead ID, name, agent, source, requirement, reason, event type, follow-up status and date range, with totals and cursor pages. Click a lead/phone to open its complete timeline.

Reporting / export

Filtered Lead 360 CSV + Print/PDF (server-built, with active filters and generated-at), full per-lead history CSV/print, follow-up history Excel/PDF, project reports, shift summaries at 12:50 and 17:30.

Daily performance

Score = connections×4 + reports×2 + follow-ups×1.5 + talk minutes×0.4, rounded. Revealed on Home at 17:30 Dhaka; breakdown shown per card.

Security / server authorization

All mutations resolve the caller on the server (session bearer, device token or signed PIN token); client-supplied actor ids are not accepted. PINs are server-verified secrets. RLS enabled on every public table. Two intentionally accepted scan findings remain documented.

Duplicate / idempotency controls

Unique: one pending report per agent, call client_upload_id, external_call_id, lead phone keys, briefing ack per agent/date/version, history correlation_id. Offline replays use the same upload ids.

Test results

tsgo --noEmit → 0 errors

bunx vitest run → Test Files 36 passed (36); Tests 241 passed (241)

Database checks: 0 public tables without RLS; 0 UPDATE/DELETE policies on history tables; history triggers present.

UI smoke (Playwright, public pages, 4 widths) → no overflow, 0 page errors.

Not verified by this audit (external / operational)

Live lock was not executed because it would interrupt real users; equivalent behavior is verified through automated controlled-date tests (maintenance 14th 00:00 Dhaka lock, verified payment, unlock expiry/re-lock, 09:05 briefing before/after/ack/next-day/stale-version). Real-device calls and recordings on agents' phones; carrier behaviour; Android release build (no Android SDK in the audit environment); signed-in agent/HQ/IT sessions end-to-end; WhatsApp Business API (not connected — tap-to-chat only); production deployment configuration; client acceptance. Staff must upload photos before calling. Historical follow-up reschedules before the change log existed cannot be reconstructed.

Deployment / release

Published at https://crm1.winstonebd.com (also webcrm-v1.lovable.app). Publishing is done from the editor's Publish button. Android APK is distributed from the IT Console releases panel.

Client handover checklist

☐ Publish the latest version

☐ Every agent uploads a staff photo

☐ Install/update Android app on each agent phone and test one real call + report

☐ HQ, IT and LeadHub PINs handed to named owners

☐ Import leads via LeadHub and assign a test quantity

☐ Confirm 09:05 briefing and 17:30 Top 3 on a working day

☐ Client sign-off
